Mini transformer 'made by Nagra'
The voice of the BPS preamplifier are equipped with very
Nagra's transformer, with a magnetic glass-metal core. As with
the recorders, it is one of the key pieces of the unit, that the
company designs and builds entirely in their own laboratories.
Nagra is one of the rare manufacturers in the audio world to
have the particular know-how, which they have perfected for
decades: one of the 'secrets' leading to the unsurpassed Nagra
quality.
Thanks to these transformers, which are mounted inside
a metal magnetic shielding, the Nagra BPS preamplifier has
excellent characteristics in terms of linearity, saturation level
and low frequency management.
A totally programmable unit
The market offers a wide range of cartridges designed for
turntables and of different technologies: Moving coil (MC) and
moving magnet (MM). These cartridges have widely varying
characteristics.
This diversity is no problem for the Nagra BPS preamplifier, as
the unit is totally programmable by the user to obtain a perfect
correlation between the load of the cartridge and the circuit.
A set of jumpers and loading modules are provided, used
depending on the different cartridge characteristics. The inputs
can also be switched to floating, that is to say disconnected
from the earth, thus avoiding all earth loop problems genera-
ting parasitic noise.
