

BLADELIUS

New Bladelius Tyr II

Bladelius Design Group is proud to introduce the new updated version of Tyr II. Two-channel music is the toughest test of an audio component. The ultimate combination of modern new design and time proven concepts, will deliver music and sound quality that you would expect from a Bladelius amplifier. As always it delivers power and current to control even the most demanding loudspeakers on the market.

New times and new demand from the market has given us the opportunity to update and improved the amplifier Tyr II. We will produce two versions of the model, one traditional and one that also will include a digital input/USB DAC and a Phono stage for MM/MC. In order to improve the sound quality and achieve our goals for the amplifier, we spend a lot of time in reworking and updating almost all of the circuits in the amplifier.

A new improved volume control circuit, which are less frequency dependent and more linear. All the signal stages have lower distortion in the high frequency range. The Power supply is improved for a more noise free current capability. The output is increased to 110 watt. Two standby modes, one for a normal standby were you are getting the normal warming up for best sound quality and one for current saving (less that 0.5 watt), follow the rules in Europe.

The DAC stage is a high performance board, based on the same circuits that are used in the award winning Freja III CD player. It has a reclklocking function that is asynchronous with the USB information. The inputs are, USB, Coaxial, Balanced and a high speed Toslink (192 kHz).

The R1aa stage is a low noise Phono stage that can handle both MM and MC pickups. To make it easy for you we have given the two models different names.

The Analog version: Tyr II Traditional

The Digital version: Tyr II Novitas
