

The new WBT-0120

A lightweight with heavy arguments

The new WBT-0120 is completely different to all previous WBT connectors.

The body of the new RCA plug is made of 100% pure high-performance plastic.

Metal decorative rings have been intentionally done away with. The new design with the oblique angle ensures **intelligent cable routing** and therefore also provides **optimal strain relief**.

Handling is rendered much simpler by the integrated eccentric lever. No more laborious twisting open and closed of the sleeve with narrow RCA socket spacings. A **clamping-spring mechanism** connected to the eccentric lever **ensures permanently elastic optimum contact pressure** of the contact unit.

The connector assembly has been rendered much simpler. The inner connection is made by means of soldering or with a flat push-on cable shoe. For simple adjustment also to thin cable diameters ensures a **collet chuck lock with kink protection**.

As with all WBT RCA plugs, the central contact unit is made in accordance with the tried and tested nextgen™ principle, and the contacts have been **gold-plated using the new WBT-PlasmaProtect™ procedure**.

All in all, the new RCA plug is an absolute lightweight with heavy arguments.
